# Classifying Finite Simple Groups with Respect to the Number of Orbits Under the Action of the Automorphism Group

- Supplementary Tables, Updated 2020-06-14 -

#### Stefan Kohl

The values  $\omega(G)$  in Table 1 have mostly been computed using GAP [4], all other data has been taken from the *Atlas of finite groups* [3]. Tables 2 and 4 have in parts been computed using GAP, and in parts using MAGMA [2] by Eamonn O'Brien in December 2019 – cf. Table 3. For Table 4, among various other information, also the bounds from [1] have been taken into account. The value  $\omega(\text{Ree}(8)) = 57$  has been determined independently by Frank Lübeck and Rob Wilson from the character table of the group and some insight on fusion of classes, and the value  $\omega(^2E_6(2)) = 91$  has been determined in a similar way by Rob Wilson.

## 1 Orbit Numbers for Small Simple Groups

Table 1: Values  $\omega(G)$  for simple groups G (sorted by group order, the enumeration of groups  $G = \mathrm{PSL}(2,q)$  was stopped at  $|G| = 10^6$ ).
